

AFRICAN AUTONOMY INDEX

Graphics and Visualizations Register

Version 1.0 | Heritage Builders | First Iteration 2026 | 19 In-Chapter Graphics + 7 GEM Visualizations

Purpose: This register provides the GEM with a complete text reference for every chart, diagram, map, and visualization in the AAI methodology document and GEM Knowledge Base. Because the GEM cannot render images, each entry includes a Golden Caption (the single authoritative statement of what the visual proves) and a GEM Talking Point (natural language the GEM uses when describing the visual to a user). This register also serves as the designer's brief for infographic production. I AM THE DESIGNER notation applies: Heritage Builders produces all final infographics; this register provides the analytical content and structural specifications.

Golden Caption: The single authoritative sentence stating what this visual proves. Italicized in gold. Use verbatim in presentations and GEM responses. GEM Talking Point: Natural-language description the GEM uses when asked about this chart. Written in the AAI Human Realism voice standard.

Part A | In-Chapter Graphics (G-001 through G-019)

Charts and diagrams embedded in AAI Chapters 1-10. All 19 entries. The designer (Heritage Builders) produces all final infographics from these specifications.

ID	Chart / Visual Name	Chapter	Section	Type
G-001	Two-Dimensional Sovereignty Framework	Ch.2	2.1	Four-Quadrant Diagram
Structure:	X axis: Economic Sovereignty (Low to High); Y axis: Political Integration (Low to High); four labeled quadrants with country examples and directional pathway arrows			
Golden Caption:	This diagram is the AAI's architectural foundation: it places every African country in one of four sovereignty quadrants defined by the intersection of economic and political capacity, and shows the development pathway each quadrant implies.			
GEM Talking Point:	Think of it as a map of where every African country stands on two axes of sovereignty -- and where they need to go. Phase 4 countries like Botswana sit in the top-right corner; Phase 1 countries like Niger sit in the bottom-left. The arrows show the path, not just the position.			
G-002	Manufacturing Value-Added Distribution	Ch.3	3.B.1	Bar Chart
Structure:	X axis: all 55 AU member states; Y axis: adjusted MVA as percentage of GDP; bars color-coded by scoring tier (15/12/9/6/3/0 points) using the Pan-African palette			
Golden Caption:	This chart reveals the depth of Africa's deindustrialization legacy: the distribution of manufacturing value-added across 55 countries shows that most African economies remain structurally locked in raw commodity export, not processed value creation.			
GEM Talking Point:	The bar chart shows every country's manufacturing score in one view. The color bands correspond directly to the scoring tiers in Indicator 3.B.1. Countries in the bottom two tiers are earning less than half of available manufacturing points -- that gap is the legacy of structural adjustment dismantling African industrial policy in the 1980s and 1990s.			
G-003	Political Integration Radar: Five Representative Countries	Ch.4	4.A	Radar / Spider Chart

Structure:	Five axes: Continental Engagement, Regional Cooperation, Governance Capacity sub-dimensions; five countries plotted (Rwanda, South Africa, Nigeria, Botswana, Eritrea); filled polygons show divergence between strong and weak sub-dimensions			
Golden Caption:	This radar chart shows that Political Integration is not a single quality but a constellation of capacities -- and that countries with identical composite scores can have radically different strength profiles across the three sub-dimensions.			
GEM Talking Point:	Eritrea's shape on this chart is nearly flat -- it scores near zero on Continental Engagement because of AU withdrawal. Compare that to Rwanda, whose polygon is broad and balanced. Same phase range, completely different structural profiles. That is exactly what the radar is built to show.			
G-004	REC Membership Map	Ch.4	4.B	Thematic Map
Structure:	Africa continental map; REC boundaries color-coded by bloc (ECOWAS, EAC, SADC, COMESA, CEMAC, IGAD, AMU, ECCAS, CEN-SAD); overlap zones highlighted for countries with simultaneous memberships			
Golden Caption:	This map shows that Africa's regional integration architecture is not a clean grid -- it is a layered web of overlapping memberships that both multiplies integration opportunities and creates the 'spaghetti bowl' coordination problem the AAI's REC scoring protocols are designed to navigate.			
GEM Talking Point:	When you see a country highlighted in two or three colors on this map, that means it holds simultaneous REC memberships. That is actually a strength in the AAI framework -- multiple memberships earn a higher integration multiplier -- but it also creates treaty conflict risks that the scoring notes document.			
G-005	Political Integration Rankings: All 55 Countries	Ch.4	4.C	Horizontal Bar Chart
Structure:	Y axis: all 55 AU member states ranked by Political Integration score; X axis: normalized score 0-100; bars color-coded by sub-Saharan, North African, and island state groupings; Phase threshold lines marked			
Golden Caption:	Ranking all 55 AU member states on Political Integration in a single chart makes visible what aggregate statistics obscure: the continental distribution is not a bell curve but a skewed landscape with a thick Phase 2 middle, a small Phase 4 peak, and a Phase 1 floor where structural isolation compounds itself.			
GEM Talking Point:	This is the full continental political picture in one chart. The three color groups -- sub-Saharan, North African, island states -- reveal a regional pattern: North African countries tend to cluster at the Phase 2/3 boundary but with lower continental engagement scores, while East African countries show stronger integration profiles on average.			
G-006	Economic vs. Political Sovereignty Scatter Plot	Ch.4	4.C	Scatter Plot
Structure:	X axis: Economic Sovereignty score (0-100); Y axis: Political Integration score (0-100); four quadrants divided at composite midpoint 60; all 55 countries plotted as labeled dots; AES Bloc and Flag M countries highlighted distinctly			
Golden Caption:	This scatter plot is the AAI's most diagnostic single visual: it shows not just where each country sits on both dimensions simultaneously, but which countries are structurally imbalanced -- leading in one dimension while lagging in the other -- and how those imbalances map onto the CFA franc zone and AES bloc designations.			
GEM Talking Point:	The diagonal tells you everything. Countries close to the diagonal are dimensionally balanced -- their economic and political development are moving together. Countries far above the diagonal are Political Leaders (Phase 3B); far below are Economic Leaders (Phase 3A). The Flag M cluster in the lower-left quadrant shows the CFA constraint concentrating a group of countries below their political potential.			
G-007	Four-Phase Profile Diagram	Ch.5	5.3	Four-Panel Horizontal Bar
Structure:	Single horizontal bar spanning 0-100 with three threshold boundaries at 35, 60, and 81; four panels labeled Phase 1 through Phase 4 with score ranges, representative country examples, key characteristics, and policy implications for each phase			

Golden Caption:	This diagram is the AAI's primary classification reference: it translates the four-phase framework from an abstract rubric into a visual continuum where the distance between thresholds encodes the structural difficulty of each transition.			
GEM Talking Point:	The gap between Phase 1 and Phase 4 is not equal steps -- it is a structural journey. The Phase 2 to Phase 3 transition at the canonical midpoint of 60 is the AAI's most consequential threshold, separating countries where structural dependency still dominates from countries where autonomy is consolidating. That is why the midpoint is 60, not 50.			
G-008	Sensitivity Analysis: Top 10 Country Rankings Under Three Weight Scenarios	Ch.5	5.5	Parallel Coordinates / Bump Chart
Structure:	Three vertical axes: Scenario A (50/50), Scenario B (60/40 ECON-heavy), Scenario C (40/60 POL-heavy); each country traced as a line across all three scenarios; phase-changers highlighted in Gold			
Golden Caption:	This chart delivers the AAI's robustness proof in one view: 93 percent of countries hold their Phase classification regardless of how the two dimensions are weighted, and the four countries that do shift phases do so in entirely predictable directions consistent with their dimensional profiles.			
GEM Talking Point:	The lines that stay flat across all three scenarios -- that is 51 of 55 countries -- are the stability story. The four lines that cross a phase boundary when you shift the weights are Morocco, Algeria, Namibia, and Senegal. All four are near the Phase 2/3 boundary at the 60-point midpoint, which is exactly where you would expect weight sensitivity to appear.			
G-009	Year-Over-Year Change Interpretation Chart	Ch.5	5.6	Horizontal Scale / Color-Banded Chart
Structure:	Horizontal scale from -10 to +10 points; five color-coded bands from deep red (Major Decline) through neutral (Stable) to green (Major Improvement); annotated real examples including Ghana's rise and fall; callout box noting changes within plus-or-minus 1 point require caution			
Golden Caption:	This chart standardizes how AAI score changes are read across iterations: it prevents both false alarm (treating data noise as policy failure) and false comfort (treating marginal gains as structural improvement), anchoring interpretation to the five change categories that have operational meaning.			
GEM Talking Point:	When a country's score moves between iterations, this chart tells you whether to pay attention. A 3-point gain is meaningful improvement. A 1-point gain is within the data-vintage noise margin. A 7-point drop warrants an indicator-by-indicator review. The Ghana callout is a reminder that rapid gains can be just as fragile as rapid declines.			
G-010	CAR Indicator Radar Chart	Ch.6	6.2	Radar / Spider Chart
Structure:	Eight Economic and seven Political indicator scores for Central African Republic plotted against Phase 2 reference threshold; indicators near zero highlighted (Manufacturing, Resource Processing, Technology, Peacekeeping, Infrastructure)			
Golden Caption:	The CAR radar chart is the AAI's starkest illustration of Phase 1 structural conditions: a nearly flat polygon showing near-zero scores on productive capacity and political engagement indicators, with only modest scores on indicators that require minimal institutional infrastructure.			
GEM Talking Point:	CAR's shape on this chart is a near-flat circle. When a country's radar polygon is this small, it does not mean the country has failed at everything equally -- it means the structural conditions for higher scores have not been built yet. That is the difference between a verdict and a diagnostic.			
G-011	Phase 4 Country Comparison: Botswana, Mauritius, South Africa	Ch.6	6.5	Grouped Bar Chart
Structure:	Three grouped bars per country: Economic Sovereignty, Political Integration, and Composite; horizontal reference line at Phase 4 threshold of 81; Pan-African palette color-coding			

Golden Caption:	Comparing the three highest-scoring countries on both dimensions simultaneously reveals that Phase 4 is not one profile but three distinct paths to continental leadership -- Botswana through institutional discipline, Mauritius through service economy diversification, and South Africa through industrial and regional scale.			
GEM Talking Point:	All three countries are above 81 composite, but look at their shapes. Botswana is almost perfectly balanced. South Africa carries a larger Political-Economic gap than its composite suggests. Mauritius earns its scores through a very different productive base than either. Phase 4 is a threshold, not a template.			
G-012	Projected Phase Transitions to 2030	Ch.6	6.6	Slope Chart
Structure:	Left anchor: 2024 composite scores; right anchor: 2030 projected scores; 10-15 countries traced as slope lines; color-coded by probability band (high, medium, low confidence); countries shown include Senegal, Kenya, Tanzania, Ethiopia, Nigeria, South Africa, Egypt, Rwanda, Algeria, Ghana, Zambia, CAR			
Golden Caption:	This slope chart is the AAI's forward-looking statement: it shows which countries are structurally positioned to cross a phase boundary by 2030, under what conditions, and with what probability -- translating the static first-iteration baseline into a trajectory map for policy planning.			
GEM Talking Point:	The steepness of each line is not a prediction -- it is a structural possibility given current indicator trajectories. Countries with steep upward slopes have specific bottlenecks that, if addressed, could move them a phase by 2030. Countries with flat or downward slopes face structural constraints that require longer-horizon interventions than a single policy cycle can deliver.			
G-013	Double-Blind Scoring Resolution Flowchart	Ch.7	7.4	Decision Flowchart
Structure:	Start node: two researchers score independently; decision diamond at discrepancy greater than 2 points; branches to data source check, calculation review, threshold interpretation; third researcher adjudicates unresolved cases; final score recorded			
Golden Caption:	This flowchart is the AAI's quality assurance architecture in visual form: it shows that every country score passes through a structured dispute-resolution process before publication, with human expert adjudication at every stage where automated comparison is insufficient.			
GEM Talking Point:	This is not a bureaucratic chart -- it is a sovereignty document. It shows that the scores are not produced by one person's judgment or one database pull. Every disputed score goes through this process. The third-researcher adjudication step is the safeguard against both data error and individual researcher bias.			
G-014	Kenya AROI Comparison Chart	Ch.9	9.2	Horizontal Lollipop / Bar Chart
Structure:	Y axis: four Kenya investment areas (Domestic bond market deepening, Digital ID and e-governance, SEZ manufacturing expansion, Road connectivity); X axis: AROI in points per \$100M; bars color-coded by priority tier (Gold = Highest, Forest Green = High, neutral = Medium)			
Golden Caption:	The Kenya AROI chart operationalizes the AAI's theory of change into a budget allocation tool: it ranks four investment scenarios by the autonomy return per \$100 million invested, showing that financial sovereignty infrastructure delivers more than twice the AAI score gain per dollar than physical infrastructure alone.			
GEM Talking Point:	The key insight on this chart is the gap between bond market deepening at 2.40 and road connectivity at 1.00. Both are legitimate investments. But if Kenya's policy goal is AAI score improvement, the financial sovereignty intervention returns more than double the autonomy gain per dollar. That is the AROI framework in action.			
G-015	EAC Convergence Bar Chart	Ch.9	9.5	Horizontal Bar Chart
Structure:	Y axis: six EAC member states ranked by composite AAI score (Kenya 69.5 down to South Sudan 18); X axis: composite score; bars color-coded by Phase (Forest Green = Phase 3, Gold = Phase 2, Crimson = Phase 1); secondary marker shows 2030 target score per country			
Golden Caption:	The EAC convergence chart makes the Ubuntu-Ujamaa solidarity argument quantitative: the 51.5-point gap between Kenya and South Sudan within a single regional bloc is not just a development disparity -- it is a structural obstacle to the collective integration gains the EAC was designed to deliver.			

GEM Talking Point:	Kenya and South Sudan are in the same regional bloc. They share borders, trade routes, and integration commitments. But their AAI scores are 51.5 points apart. The EAC cannot reach its integration potential while that gap persists. The 2030 target markers on each bar show what the convergence trajectory would need to look like for the bloc to develop as a unit.			
G-016	CFA vs. Non-CFA Monetary Sovereignty Comparison	Ch.9	9.7	Side-by-Side Dot Plot / Horizontal Bar Chart
Structure:	Two columns: CFA (BCEAO) on the left, Non-CFA ECOWAS on the right; each country plotted by Monetary Sovereignty score out of 20; CFA Average (9.4/20) and Non-CFA Average (16.7/20) marked as bold reference lines; 7.3-point gap labeled; Crimson for CFA zone, Forest Green for Non-CFA			
Golden Caption:	This chart is the AAI's most direct indictment of the CFA franc architecture: the 7.3-point gap in Monetary Sovereignty scores between CFA zone and non-CFA ECOWAS peers is the largest single-indicator differential in the entire AAI dataset, and it is not a market outcome -- it is a structural artifact of a colonial monetary agreement that was never designed for African developmental sovereignty.			
GEM Talking Point:	The 7.3-point gap between the two reference lines is the data behind the ECO argument. Non-CFA ECOWAS countries average 16.7 out of 20 on Monetary Sovereignty. CFA countries average 9.4. That difference does not come from different central banking competence -- it comes from the Operations Account arrangement that routes 50 percent of CFA reserves through the French Treasury. The ECO is the institutional intervention designed to close that gap.			
G-017	Dimension Imbalance Risk Matrix	Ch.10	10.2	Scatter Plot with Diagonal Risk Zones
Structure:	X axis: Economic Sovereignty score; Y axis: Political Integration score; all 55 countries plotted as dots, color-coded by Phase; diagonal midline shows Balanced zone (gap less than 10 points); outer bands show Watch and At-Risk zones; inset SAS adjustment chart for At-Risk countries			
Golden Caption:	This matrix is the AAI's structural vulnerability map: by showing where each country falls relative to the balanced-development diagonal, it reveals how many African countries have been systematically pushed off the path of integrated sovereignty development -- and in which direction.			
GEM Talking Point:	The diagonal is the balance line. Countries close to it are developing economic and political capacity at roughly the same pace. Countries far above it are building political institutions faster than their economic base can sustain. Countries far below -- often the CFA bloc -- are producing economic activity that the monetary architecture prevents from translating into monetary sovereignty. The gap from the diagonal is often not an accident. It was engineered.			
G-018	Ten Priority Reforms Impact Chart	Ch.10	10.4	Horizontal Lollipop / Bar Chart
Structure:	Y axis: ten structural decolonization reforms; X axis: expected AAI composite point gain range; color-coded to highlight Priority 1 (CFA exit) and Priority 3 (domestic resource processing) as top structural decolonization reforms			
Golden Caption:	This chart translates the AAI's Ten Priority Reforms into a ranked policy agenda: it shows not just which reforms matter most for African sovereignty but by how many composite points each reform would move the average affected country -- making the Afrocentric policy argument in the language of measurable institutional change.			
GEM Talking Point:	Priority 1 is CFA exit. Priority 3 is domestic resource processing. Those two reforms sit at the top of this chart because they address the two most structurally entrenched sovereignty constraints in the dataset: monetary architecture and extractive dependency. The point ranges on each bar reflect the range across affected countries, not uncertainty about the reform's value.			
G-019	Africa 2063 Phase Distribution Comparison	Ch.10	10.8	Side-by-Side Donut Charts

Structure:	Two donut charts: left shows 2025 Phase distribution (Phase 1: 19%, Phase 2: 46%, Phase 3: 28%, Phase 4: 7%); right shows 2063 Agenda target (Phase 4: 56%, Phase 3: 37%, Phase 2: 7%, Phase 1: 0%); Pan-African palette (Forest Green, Gold, Crimson, neutral)
Golden Caption:	This paired donut chart is the AAI's closing argument: the distance between the two charts is not a forecast but an obligation -- the structural transformation Agenda 2063 demands of the continent is measurable, achievable, and now indexed.
GEM Talking Point:	The left donut is where Africa stands today. The right donut is where Agenda 2063 says Africa must be by 2063. The dominant color shifts from Gold (Phase 2) to Forest Green (Phase 4). That is not a hope -- it is a mapped trajectory. Every policy decision between now and 2063 either closes or widens the distance between those two charts.

Part B | GEM Knowledge Base Visualizations (G-EXT-01 through G-EXT-07)

Charts produced for the GEM Knowledge Base (primarily GEM Doc 5: Sensitivity Scenario Matrix). These are built from the AAI_All_Countries_Scores.csv dataset.

ID	Chart / Visual Name	Chapter	Section	Type
G-EXT-01	Tornado Weight Swing Chart	GEM Doc 5	Sensitivity	Tornado Chart
Structure:	Horizontal bars showing score swing range for each country under 60/40 vs. 40/60 weight scenarios; countries sorted by magnitude of swing; phase-changers highlighted in Gold			
Golden Caption:	The tornado chart shows at a glance which countries are most sensitive to weighting assumptions -- the wider the bar, the more a country's score depends on which dimension you weight more heavily.			
GEM Talking Point:	The four phase-changers (Morocco, Algeria, Namibia, Senegal) appear near the top of this chart with the widest bars. Every other country shows a narrow swing -- confirmation that for 93 percent of the dataset, the Phase classification is robust regardless of how you weight the two dimensions.			
G-EXT-02	Econ vs. Political Scatter (Sensitivity Overlay)	GEM Doc 5	Sensitivity	Scatter Plot
Structure:	X axis: Economic Sovereignty; Y axis: Political Integration; all 55 countries plotted; phase boundary lines at 35, 60, 81 shown as diagonal zones; phase-changers circled and labeled; standard axis orientation (X = ECON, Y = POL)			
Golden Caption:	This sensitivity scatter overlays the phase-changer analysis directly onto the dimensional framework, showing that all four phase-sensitive countries sit within a narrow band just below the Phase 3 threshold -- exactly where weighting shifts would be expected to have the most impact.			
GEM Talking Point:	Look at where the four circled countries sit. They are all clustered just below the Phase 2/3 boundary at composite 60. That proximity to the threshold is why they are sensitive to weighting. A country comfortably inside Phase 2 at 45 composite is not going to shift phases because you change the weight from 50/50 to 60/40. Only border-zone countries move.			
G-EXT-03	Scenario Heatmap	GEM Doc 5	Sensitivity	Heatmap
Structure:	Rows: all 55 countries; columns: three scenarios (50/50, 60/40, 40/60); cells color-coded by Phase assignment; gold cells mark phase-changers; sorted by composite score descending			
Golden Caption:	The scenario heatmap provides the complete phase-stability record for all 55 countries across all three weight configurations in a single view -- the most comprehensive robustness summary the AAI produces.			
GEM Talking Point:	Scan the heatmap vertically. If a row is one color across all three columns, that country is Phase-stable. The four gold cells in the matrix are the only phase transitions in the entire dataset. That is the stability story the AAI can stand on when weighting assumptions are challenged.			
G-EXT-04	Tier Migration Chart	GEM Doc 5	Sensitivity	Slope/Migration Chart

Structure:	Left axis: Phase assignments under 50/50 baseline; right axis: Phase assignments under 60/40 or 40/60 scenarios; lines connecting each country's Phase position across scenarios; phase-changers shown as crossing lines
Golden Caption:	The tier migration chart shows that phase transitions under alternative weight scenarios are not random -- they follow the directional logic of the dimensional profiles, with ECON-heavy weighting benefiting Economic Leaders and POL-heavy weighting benefiting Political Leaders.
GEM Talking Point:	Morocco crosses a phase boundary under the 60/40 ECON-heavy scenario because it is an Economic Leader -- its Econ score is already above 60 while its Political score is below. Give more weight to the dimension it leads in, and it crosses the threshold. Algeria, Namibia, and Senegal cross in the opposite direction under 40/60 for the same structural logic.

G-EXT-05	Regional Box Plots	GEM Doc 5	Sensitivit y	Box Plot
Structure:	Five regional groupings on X axis (West Africa, East Africa, Southern Africa, Central Africa, North Africa); composite score distribution on Y axis; box shows interquartile range; whiskers show full range; outliers labeled by country name; Phase threshold lines at 35, 60, 81			
Golden Caption:	The regional box plots reveal that the AAI's Phase distribution is not random across geography -- each regional cluster has a distinct median, spread, and outlier pattern that reflects the specific colonial and institutional histories shaping sovereignty development in that part of the continent.			
GEM Talking Point:	East Africa has the widest spread of any regional box -- from South Sudan near the bottom to Kenya and Rwanda near the top. That range within a single region reflects the diversity of institutional trajectories even among neighboring countries. West Africa's box sits lower, pulled down by the CFA constraint on monetary sovereignty scores across the Francophone bloc.			

G-EXT-06	Missing Data Sensitivity Chart	GEM Doc 5	Sensitivit y	Bar Chart
Structure:	X axis: flag categories (Flag 0, Flag 1, Flag 1-AES, Flag 2, Flag 3); Y axis: average composite score impact of applying vs. not applying the multiplier; bars show score reduction in points; country examples labeled on each bar			
Golden Caption:	This chart makes the flag system's structural impact transparent: it shows exactly how many composite points each missing data penalty costs on average, grounding the flag designations in their quantitative consequences rather than treating them as abstract labels.			
GEM Talking Point:	Flag 3 costs an average of 15 percent of a country's raw composite score. For a country scoring 40 raw, that is 6 points removed before publication. That is not a minor footnote -- it is the difference between Phase 2 entry and deep Phase 1. The chart makes that real.			

G-EXT-07	Autonomy Matrix	Multiple	Overview	Four-Quadrant Scatter
Structure:	X axis: Economic Sovereignty; Y axis: Political Integration; midpoint lines at 60 on both axes creating four quadrants; all 55 countries plotted; Phase-coded colors; quadrant labels (High/High, High/Low, Low/High, Low/Low); flag overlays			
Golden Caption:	The Autonomy Matrix is the AAI's master visual: it synthesizes the entire 55-country dataset into a single analytical frame, showing the distribution of African sovereignty development across both dimensions simultaneously and making the structural clustering of CFA, AES, and Phase 4 countries immediately visible.			
GEM Talking Point:	This is the chart you show first in any presentation. It tells the whole AAI story in one frame. The upper right is where Africa is going. The lower left is where structural dependency has kept too many countries for too long. The clustering of Flag M countries in the middle-left quadrant is not an accident -- it is the monetary architecture made visible.			

Part C | Design Standards for All AAI Visualizations

Pan-African Palette	Forest Green #1A432D Gold #D4A017 Crimson #8B261D Neutral background #F9F7F1
Axis Standard	ALL scatter plots: X axis = Economic Sovereignty (ECON); Y axis = Political Integration (POL). Fixed. No exceptions.

Midpoint Lines	Phase boundary lines at 35, 60, and 81 on all relevant charts. Midpoint = 60, never 50.
Flag Notation	CFA zone countries: distinct color or marker. AES countries: distinct marker. SADR: footnote notation.
Dimension Labels	Economic Sovereignty (ECON) and Political Integration (POL). Never 'Economic Integration' or 'Political Sovereignty'.
No Em Dashes	No em dashes, long dashes, or double hyphens in any chart label or caption. Use commas, semicolons, or colons.
Designer Note	Heritage Builders produces all final infographics. This register provides analytical specifications and Golden Captions only. GEM uses the text descriptions when images are not available.

AAI Graphics and Visualizations Register v1.0 | Heritage Builders | First Iteration 2026 | 19 In-Chapter Graphics (G-001 through G-019) | 7 GEM Visualizations (G-EXT-01 through G-EXT-07) | 26 Total Entries | All Golden Captions GEM-ready
